## **AMENDMENTS TO THE CLAIMS:**

The following listing of claims will replace all prior versions and listings of claims in the application. Please cancel claims 38-48 without prejudice or disclaimer and amend claim 1, as follows:

- 1. (Currently Amended) A stage device comprising:
- a base;
- a stage positioned adjacent to the base and movable relative to the base;
- a bearing assembly comprising at least one fluid bearing interposed between the base and the stage for supporting the stage on the base and movable in two directions substantially orthogonal with respect to one another and independent of each of relative to the base and the stage.
- 2. (Original) The stage device of claim 1 further comprising a motor for moving the stage relative to the base in at least one degree of freedom over a stroke of the stage.
- 3. (Original) The stage device of claim 2 further comprising a motor operable to move the bearing assembly relative to the stage and the base in a direction generally the same as a direction of movement of the stage at a velocity approximately one half of the velocity of the stage.
- 4. (Original) The stage device of claim 3 wherein the bearing motor has a lower bandwidth than the stage motor.

U.S. Application No.: 09/773,818 Inventors: Martin LEE et al.

Attorney Docket No.: 371922003400 FHFG&D Docket No.: 07303.0064-00000

5. (Original) The stage device of claim 2 wherein the base has a generally

planar surface, the bearing assembly being positioned for movement over said planar

surface, said surface having an X dimension approximately equal to the X diameter of

the bearing plus one half of the X stroke of the stage; and having a Y dimension

approximately equal to the Y diameter of the bearing plus one half of the Y stroke of the

stage.

6. (Original) The stage device of claim 2 wherein the stage motor is operable to

move the stage relative to the base in five additional degrees of freedom.

7. (Original) The stage device of claim 2 wherein the stage motor is a planar

motor.

8. (Original) The stage device of claim 2 wherein the stage motor is a linear

motor.

9. (Original) The stage device of claim 1 wherein the bearing assembly

comprises a retaining member, said at least one fluid bearing being attached to the

retaining member for movement therewith.

10. (Original) The stage device of claim 9 further comprising a motor for driving

the retaining member in a direction generally following the direction of the stage.

-3-

U.S. Application No.: 09/773,818 Inventors: Martin LEE et al. Attorney Docket No.: 371922003400

FHFG&D Docket No.: 07303.0064-00000

11. (Original) The stage device of claim 10 further comprising a shaft having one end attached to the motor and the other end attached to the retaining member for moving the retaining member.

- 12. (Original) The stage device of claim 9 wherein the retaining member is a generally rectangular plate and said at least one fluid bearing comprises four bearings, each bearing being attached to a corner of the plate.
- 13. (Original) The stage device of claim 12 wherein the base comprises four base pads disposed on an upper surface of the base, and wherein the stage comprises four stage pads disposed on a lower surface of the stage, each pad being positioned for receiving one of the bearings thereon for movement of the bearing between the base and stage.
- 14. (Original) The stage device of claim 1 wherein the fluid bearing is an air bearing.
  - 15. (Original) The stage device of claim 1 wherein the bearing is preloaded.
- 16. (Original) The stage device of claim 15 wherein the preload is provided by a gravitational weight of the stage.
- 17. (Original) The stage device of claim 15 wherein the preload is provided by at least one spring attached between the stage and the base.

U.S. Application No.: 09/773,818 Inventors: Martin LEE et al.

Attorney Docket No.: 371922003400

FHFG&D Docket No.: 07303.0064-00000

18. (Original) The stage device of claim 15 wherein the preload is provided by at

least one bearing placed between the stage and the base.

19. (Original) The stage device of claim 15 wherein the bearing assembly

incorporates a vacuum preloading mechanism.

20. (Original) The stage device of claim 19 wherein the fluid bearing comprises

two bearing members, each including a port and a cavity, the port communicating with

the cavity and connected to a vacuum pump such that the cavity can be evacuated

through the port.

21. (Original) The stage device of claim 20 wherein each bearing member has

an outer surface having a groove and an annular array of orifices within the groove, and

a plenum that connects the orifices to a fluid inlet.

22. (Original) The stage device of claim 20 wherein each bearing member has

an outer bellows and a channel connecting the cavities, the channel being isolated

within the outer bellows by an inner bellows.

23. (Original) The stage device of claim 1 wherein the fluid bearing is operable

in a vacuum.

-5-

U.S. Application No.: 09/773,818 Inventors: Martin LEE et al. Attorney Docket No.: 371922003400

FHFG&D Docket No.: 07303.0064-00000

24. (Original) The stage device of claim 1 wherein said at least one bearing comprises a plurality of bearings, each bearing being adjustable in a direction generally orthogonal to a plane of the base upon which the bearings slide.

- 25. (Original) The stage device of claim 24 wherein each bearing is generally cylindrical in shape and comprises a sidewall flexible in an axial direction to allow for adjustment of the height of the bearings.
- 26. (Original) The stage device of claim 24 wherein each bearing comprises a bellows.
- 27. (Original) The stage device of claim 26 wherein each bearing comprises a port for providing fluid to the bellows to increase pressure within the bearing and increase the height of the bearing.
- 28. (Original) The stage device of claim 1 wherein the fluid bearing has two generally planar surfaces on each end thereof, one outer surface being angularly rotatable relative to the other surface to compensate for variations in planar surfaces of the base and stage over which the bearing slides.
- 29. (Original) The stage device of claim 1 wherein the fluid bearing comprises two bearing members, each bearing member having an outer surface with an orifice for delivering fluid therefrom, and an inner surface, the two bearing members being positioned with the inner surfaces adjacent one another, and a flexible coupling

U.S. Application No.: 09/773,818 Inventors: Martin LEE et al. Attorney Docket No.: 371922003400

FHFG&D Docket No.: 07303.0064-00000

connecting the two bearing members together to allow for angular rotation of each bearing member relative to the other bearing member to compensate for variations in planar surfaces of the base and stage over which the bearings slide.

- 30. (Original) The stage device of claim 29 wherein the flexible coupling comprises a bearing interposed between the two bearing members and received within generally spherical recesses formed in the inner surfaces thereof.
- 31. (Original) The stage device of claim 1 further comprising a platform extending from the base and movable relative thereto in a direction generally perpedicular to a planar surface of the base upon which the bearing moves.
- 32. (Original) The stage device of claim 31 wherein the platform is movable about two axes forming a plane of the planar surface of the base.
- 33. (Original) The stage device of claim 31 further comprising an actuation device operable to move the platform.
- 34. (Original) The stage device of claim 33 wherein the actuation device comprises a piezoelectric actuator.
- 35. (Original) The stage device of claim 33 wherein the actuation device comprises a hydraulic actuator.

U.S. Application No.: 09/773,818 Inventors: Martin LEE et al.

Attorney Docket No.: 371922003400 FHFG&D Docket No.: 07303.0064-00000

36. (Original) The stage device of claim 33 wherein the actuation device comprises a piezoelectric actuator operable to make small changes in a position of the platform and a hydraulic actuator operable to make relatively large changes in a position of the platform.

37. (Original) The stage device of claim 33 further comprising a plurality of actuation devices independently controlled to provide movement of the platform about two axes forming a plane of the planar surface of the base upon which the bearing moves.

Claims 38-48 (Canceled).
